

4 October 2026

CONFIDENTIAL OCCUPATIONAL THERAPY PROGRESS REPORT

Name : Roland le Roux
Date of Birth : 8 October 2021
Date of Reassessment : September 2026
Chronological Age : 4 years, 11 months
School : Huppelland Pre-Primêr

1. Relevant Background Information

Roland was initially assessed on 20 April and 4 May 2026. He has received 13 individual occupational therapy sessions of 45 minutes each. He has made the following progress, as quantified by the scale below:

- 1** Definite difficulty in this area with functional implications that impact on more than one area of the child's daily life (e.g. at home/ school/ socially/ emotionally/ transportation/ dependence) that is no longer age-appropriate.
- 2** There is some difficulty in this area, with functional implications in at least one area of the child's life.
- 3** Some residual weakness in this area. Still vulnerable to stress, not always consistent in performance, and still needing some external support, such as occasional adult guidance, assistive devices, and continued practice with a specific focus on this area.
- 4** More appropriate functioning in this area, but quality/ speed or neatness is still affected. Subtle signs of immaturity are still evident.
- 5** Optimal performance in this area.

GOALS 11 May 2026	May 2026	Sept 2026	GOALS PROGRESS SEPTEMBER 2026
Postural Control and Body Awareness - He will be able to maintain his balance on his right and left leg independently for 10 seconds with his eyes closed (currently 3 seconds) due to sufficient proprioceptive feedback. - He will be able to maintain a full-body flexion position for at least 15 seconds (currently 8 seconds). - His reflexes will be integrated, enabling improved sitting posture during the day. - He will be able to maintain an upright sitting posture at the desk for 15-20 minutes without feeling the need to prop his head in his non-dominant hand when his neck muscles fatigue.	3	4	- Roland's balance has improved to 8/10 with his right leg, and 6/10 with his left leg. He was hesitant to try with his eyes closed. - Roland's postural endurance is still compromised, and he is able to maintain a full-body flexion position for 10/15 seconds.

Bilateral Integration Skills • He will be able to cross his midline during desk activities without switching crayons from the one hand to the other. • He will be able to feed the paper with his supporting hand during cutting activities. • He will be able to smoothly perform 10 star jumps (legs only) and smoothly perform bilateral tasks like hopscotch (legs open and closed).	3	4	• Roland mostly crosses his midline, however, it still requires some effort. • Roland is now able to perform 10 star jumps smoothly, even though his speed varies at times. • He only switches hands 20% of the time, and is more consistent in using his left hand.
Fine Motor and Visual Perception • He will be able to cut on straight lines, with his thumb facing upwards. • He will not feel the need to switch hands during colouring due to low endurance of his finger muscles. • He will develop a three-point pencil grasp and an open webspace, rather than wrapping his thumb around the crayon. • He will have more control over his pencil when moving it over a page from one point to another. • He will score within his age norm (currently 4 years) when copying shapes.	2	3	• Roland is more aware of adjusting his grasp, but does need prompting and reminding to do so. • Due to limited endurance, Roland is not keen to spend ongoing time colouring, due to endurance. • His ability to cut on straight lines has improved, however his quality still needs refinement on curved lines. He also requires ongoing prompting to adjust his supporting hand while cutting. • Roland is still learning to exert control over his pencil movements.

2. Recommendations

- Roland's parents requested to pause therapy for the fourth term. Future occupational therapy intervention will be beneficial for him.
- Roland's progress should be monitored by his teacher and at home. Ongoing support at home is recommended, as set out below:

Crossing the Midline	• Encourage activities that enable trunk rotation and crossing the midline from left to right.
Cutting	• Encourage various cutting activities to improve intrinsic finger endurance and confidence in cutting. • He may require some verbal prompting to rather rotate the page with his supporting hand, rather than lifting from his left shoulder.
Pencil Control	• To increase Roland's willingness to draw, it is advised to draw "connect the dot" pictures for him. "How to draw" videos on YouTube also provides guidance. • Prompting Roland on his grasp is advisable, as he is already aware of a more practical grasp, but requires reinforcement. • The use of a pencil grasp may be helpful in Grade R and should be monitored. • Rotate the page 45 degrees to the left, as this is more comfortable for the left-handed learner.
Colouring Endurance	• Encourage the colouring of small pictures to activate small fine motor movements, and to ensure success.

	• Encourage fine motor activities with pegs, tweezers, elastics and play dough for strengthening.

Occupational Therapist
Sensory Integration Certificate

50 FINE MOTOR ACTIVITIES

Bilateral Coordination Skills

1. Use peg boards
2. Lacing cards
3. Building with Legos®
4. Tear lettuce into pieces for a salad
5. Tear construction paper for a collage
6. Peeling stickers
7. Spread icing on cookies or cupcakes
8. Use both arms to twirl streamers
9. Making bead necklaces or bracelets
10. Putting up to 12 piece puzzles together

Scissor Skills

11. Cut straws into 3rds and use to make a necklace
12. Complete 4-6 turn mazes
13. Cut out circle, triangle, and square shapes
14. Cut out clothes for stick people with craft sticks
15. Folding paper into fourths
16. Cutting with crinkle cut or design scissors
17. Threading Buttons
18. Cut out colored lines and make a rainbow
19. Cutting yarn
20. Complete a cutting activity book

50 FINE MOTOR ACTIVITIES

Pre-Writing Skills

21. Use clothespins to pick up objects
22. Pinch fruit loops and slide over tooth picks
23. Form letters with wiki stix
24. Push beads onto pipe cleaners
25. Form lines and shapes with pipe cleaners
26. Use fine motor tweezers or tongs to pick up objects
27. Trace letters in shaving cream
28. Trace sandpaper letters
29. Use letter stamps to form their name
30. String letter bead on string to form their name

Fine Motor Control

31. Use a hole punch to cut out designs
32. Button or unbutton large buttons on clothing or button board
33. Drawing a person with at least 6 body parts included
34. Learn to tie their shoes
35. Build complex shapes (towers, bridges, pyramids, etc) with blocks
36. Screwing various size lids onto containers
37. Practice coloring within the lines
38. Tracing around their own hand with a pencil or crayon
39. Reeling a fishing pole.
40. Simple food preparation (measuring, stirring, cutting soft items with a butter knife)
